

CampusAssist AI — Project Planning

Project Title:	CampusAssist AI – Smart IT Support Portal and AI-Assisted Troubleshooting System
Author:	Santhosh Akkiseti
Platform:	ServiceNow
Phase:	2. Project Planning Phase (2.1)

1. Objective

The objective of this project is to build an interactive, self-service IT support portal on ServiceNow named **CampusAssist AI**. It features the **CampusCare AI** chatbot to help students troubleshoot common IT issues (Wi-Fi, Hardware, Software, and Account Lock) and automatically escalate unresolved problems into structured IT support tickets.

2. Scope

The project focuses strictly on campus IT support operations. It includes interactive guided troubleshooting, session state management, pre-filled escalation forms, and custom ServiceNow table storage for ticket tracking. It excludes non-IT administrative features.

3. Project Roadmap

Ideation ↓ Planning ↓ ServiceNow Development ↓ Testing ↓ Documentation ↓ Demo

4. Main Modules

- **Service Portal Pages:** Includes `campusassist_home` and `campuscare_chatbot` for student access.
- **CampusCare AI Chatbot Widget:** Custom Service Portal widget using HTML, CSS, JavaScript, AngularJS, and Glide APIs for interactive dialogs.
- **Guided Troubleshooting Engine:** Interactive flows for Wi-Fi, Hardware, Software, and Account Lock issues, including session resets.
- **Escalation & Ticket System:** Captures chat context to pre-fill request forms and stores records in `x_2065601_campus_0_student_it_request`.

5. Development Steps

- **Data Model Configuration:** Created custom table `x_2065601_campus_0_student_it_request` with fields: `student_name`, `student_id`, `department`, `issue_type`, `description`, and `state`.
- **Service Portal Setup:** Created `campusassist_home` and integrated the chatbot page `campuscare_chatbot`.
- **Widget Implementation:** Developed HTML/CSS views and AngularJS Client Controllers along with Server Scripts using Glide APIs to manage session state and record insertion.

6. Testing Plan

Validate end-to-end functionality across all issue categories (Wi-Fi, Hardware, Software, Account Lock), test session resets, verify context transfer during escalation, and ensure record creation in ServiceNow.

7. Documentation & Demonstration Plan

Prepare step-by-step PDF technical reports, testing logs, user acceptance criteria, and a structured execution sequence for live demonstration.

8. Expected Result

A fully functional ServiceNow self-service portal that resolves basic student IT issues instantly and automates structured ticket creation for complex problems.
