

CampusAssist AI — Brainstorming Idea

Project Title: CampusAssist AI – Smart IT Support Portal and AI-Assisted Troubleshooting System
Author: Santhosh Akkiseti
Platform: ServiceNow
Phase: 1. Ideation Phase (1.1)

1. How the Project Idea Came Up

While observing day-to-day technical issues faced by students on campus, I noticed that a vast majority of IT problems are routine and repetitive. Whether it is an issue with connecting to campus Wi-Fi, getting locked out of a portal account, or configuring basic software for lab work, students usually have to visit the helpdesk or raise a ticket manually. The IT team spends a lot of time answering the same basic questions every day, while students face unnecessary delays for simple fixes.

2. Common Campus IT Problems

Through discussions with fellow students, I identified four recurring IT support challenges:

- **Wi-Fi Connectivity:** Authentication failures, wrong network configurations, or signal drops on student devices.
- **Account Locks:** Students frequently lock their portal accounts due to incorrect passwords during high-traffic registration periods.
- **Software Configuration:** Difficulty installing or setting up required lab software, IDEs, and tools on personal laptops.
- **Basic Hardware Issues:** Peripheral connectivity problems, display configuration issues, and keyboard layout glitches.

3. Initial Idea & Proposed Solution

My initial thought was to build a self-service support portal. However, static FAQ pages are rarely read by students. To solve this, I decided to create an interactive, chatbot-driven support system called **CampusAssist AI**. The system guides students through step-by-step troubleshooting based on their specific issue type. If the problem remains unresolved, the chatbot automatically escalates the issue by pre-filling an official IT request form with all previous context.

4. Why I Selected CampusAssist AI on ServiceNow

ServiceNow provides a robust IT Service Management (ITSM) framework with powerful Service Portal capabilities and custom data table support. Building CampusAssist AI on ServiceNow allowed me to connect an interactive widget frontend directly to backend incident tracking, making the workflow seamless from self-troubleshooting to ticket creation.

5. Main Features

- **CampusCare AI Chatbot:** Interactive, guided troubleshooting for Wi-Fi, Hardware, Software, and Account Lock issues.

- **Context-Aware Escalation:** Seamlessly transfers problem details from the chat session into a pre-filled IT request form.
- **Session Reset & Multiple Issue Handling:** Allows students to troubleshoot multiple problems or restart their session anytime.
- **Custom Student IT Request Table:** Tracks student details, issue categories, descriptions, and ticket states structured within ServiceNow.

6. Expected Benefits

Key Outcome: Students get instant 24/7 help for common IT issues without waiting for helpdesk hours, while campus IT staff can focus on complex technical tasks rather than repetitive basic queries.
