

CampusAssist AI — Problem Statement Context

Project Title:	CampusAssist AI – Smart IT Support Portal and AI-Assisted Troubleshooting System
Author:	Santhosh Akkiseti
Platform:	ServiceNow
Phase:	1. Ideation Phase (1.2)

1. Current Problem

In many educational institutions, IT support operations rely heavily on manual ticketing or in-person visits to the helpdesk. When students face minor technical difficulties—such as Wi-Fi network disconnection, password lockouts, or basic software setup errors—they often lack instant, guided tools to resolve these issues independently.

2. Problems Students Face

- **Long Waiting Times:** Students have to wait for helpdesk opening hours or queue up physically for minor fixes.
- **Lack of Self-Service Options:** Finding specific solutions from long, static PDF manuals or FAQ pages is tedious and time-consuming.
- **Academic Disruption:** Wi-Fi or portal login failures right before online exams, assignment submissions, or lab sessions cause significant stress.
- **Repetitive Ticket Writing:** Re-typing personal and technical details repeatedly whenever a new ticket is submitted.

3. Problems IT Support Faces

- **Ticket Overload:** High volume of low-complexity tickets consumes valuable staff bandwidth.
- **Repetitive Work:** IT technicians spend hours explaining standard steps (like clearing browser cache or forgetting Wi-Fi networks).
- **Incomplete Incident Context:** Manually created tickets often lack clear initial problem details, requiring back-and-forth emails to clarify the exact issue.

4. Why the Existing Approach is Inconvenient

The traditional approach is slow and inefficient for both parties. Students want immediate resolutions on their personal devices, while IT staff need a structured way to filter out simple questions before they turn into support tickets. Static documentation fails because students prefer interactive, conversational assistance.

5. Proposed Solution

CampusAssist AI introduces a smart Service Portal on ServiceNow equipped with the **CampusCare AI** chatbot widget. The chatbot offers step-by-step guided troubleshooting for Wi-Fi, Hardware, Software, and Account Lock issues. If the self-guided steps do not fix the problem, the system allows one-click escalation to pre-fill and submit a ticket into the custom `x_2065601_campus_0_student_it_request` table.

6. Expected Improvement

Impact: Reduces IT ticket volume for routine issues by enabling instant student self-resolution, speeds up support turnaround times, and ensures all escalated tickets arrive with pre-populated, structured issue details.
